EXERCISE 10.3.3

1. Solve the following pair of linear equations by the substitution method.

(I) $x + y = 14$
 $x - y = 4$

(II) $s - t = 3$

(III) $3x - y = 3$
 $9x - 3y = 9$

(IV) $0.2x + 0.3y = 1.3$
 $0.4x + 0.5y = 23$

(V) $\sqrt{2x} + \sqrt{3y} = 0$
 $\sqrt{3x} - \sqrt{8y} = 0$

(VI) $\frac{3x}{2} - \frac{5y}{2} = -2$
 $\frac{x}{3} + \frac{y}{2} = \frac{13}{6}$

2. Solve $2x + 3y = 11$ and $2x + 4y = -24$ and hence find the value of m for which $y = mx + 3$

3. Form the pair of linear equations for the following problems and find their solutions by the substitution method

(I) The difference between two numbers is 26 and one number is three times the other. Find them.

(II) The larger of two supplementary angles exceeds the smaller by 18 degrees. Find them.

(III) The coach of a cricket team buys 7 balls and 6 bats for ₹ 3800. Later, she buys 3 bats and 5 balls for ₹ 1750. Find the cost of each bat and each ball.

(IV) The taxi charges in a city consist of a fixed charge together with the charges for the distance covered. For a distance of 10 km, the charge paid is ₹ 105 and for a distance of 15 km, the charge paid is ₹ 155. What are the fixed charges and the charge per km? How much does a person have to pay for travelling a distance of 25 km ?

- (V) A fraction becomes $\frac{9}{11}$ if 2 is added to both the numerator and the denominator. If 3 is added to the numerator and the denominator, it becomes $\frac{5}{6}$. Find the fraction.
- (VI) Five years hence, the age of Jacob will be three times that of his son. Five years ago, Jacob's age was seven times that of his son. What are their present ages?
